

# Resistance Temperature Detector

KIMBERLY OWEN  
PETER THOMSEN  
DANNY RIPPE

## Overview

---

- Temperature to resistance relation
- Pure metal

# Wire Wound RTD

---

Most Accurate  
Fragile  
Slower Response Time

# Coiled Element RTD

---

Fairly Accurate  
Sturdy  
Good Response Time

# Thin Film RTD

---

Least Accurate  
Cheap  
Best Response Time

# In-Depth

---

# Sensor Connections

2-Wire Single

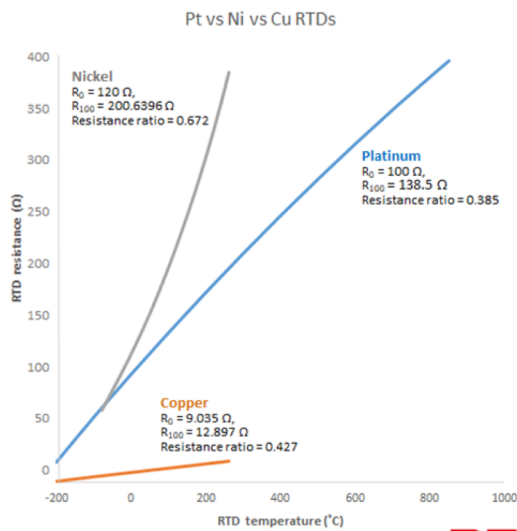

3-Wire Single

4-Wire Single

3-Wire Dual

## Temperature Calculation

# Temperature Calculation

---

Resistance Ratio:

$$\frac{(R @ 100^\circ \text{C}) - (R @ 0^\circ \text{C})}{(R @ 0^\circ \text{C})}$$

- Metals with higher resistance ratios and higher resistances at 0°C give greater accuracy

Error:

$$\text{Lead wire resistance} / [(R @ 100^\circ \text{C}) - (R @ 0^\circ \text{C})] * 0.01$$

- Select material based on necessary error for application

# Temperature Calculation

---

- Resistance Ratio defines the average slope of the curve relating resistance and temperature from 0°C to 100°C

- Often, for other ranges, the curve is no longer linear (produces error calculation)

- Use resistance ratio to calculate approximate value, then use error to calculate tolerance range

- Range of linearity defines the class of RTD

- Tables and graphs give accurate values for reference

- Callendar Van Dusen Equations give greater accuracy

# Materials

---

RTD type	Maximum measurement range	Long term stability	Corrosion resistance	Temperature vs. resistance linearity	Typical resistance at 0°C	Typical resistance at 100°C	Change in resistance 0...100°C	Resistance ratio $(R_{100}-R_0)/R_0$	Alpha ( $\alpha$ ) $(R_{100}-R_0)/(100 \times R_0)$
Platinum	-200...850°C	Excellent	Excellent	Good	100 $\Omega$	138.5 $\Omega$	38.5 $\Omega$	0.385	0.00385
Nickel	-80...260°C	Fair	Good	Fair	120 $\Omega$	200.64 $\Omega$	80.64 $\Omega$	0.672	0.00672
Copper	-200...260°C	Good	Fair	Excellent	9.035 $\Omega$	12.897 $\Omega$	3.86 $\Omega$	0.427	0.00427

# Sources of Error

---

- At high temperatures, the resistivity of some materials can change
- Must make design considerations at high temperatures such as protecting it with a probe made of a ceramic

## Applications

## RTD Pros and Cons

	RTD	Thermocouple	Thermistor
Temp. range	-260 to 850°C (-436 to 1562°F)	-270 to 1800°C (-454 to 3272°F)	-80 to 150°C (-112 to 302°F) (typical)
Sensor cost	Moderate	Low	Low
System cost	Moderate	High	Moderate
Stability	Best	Low	Moderate
Sensitivity	Moderate	Low	Best
Linearity	Best	Moderate	Poor
Specify for:	<ul style="list-style-type: none"> <li>• General purpose sensing</li> <li>• Highest accuracy</li> <li>• Temperature averaging</li> </ul>	<ul style="list-style-type: none"> <li>• Highest temperatures</li> </ul>	<ul style="list-style-type: none"> <li>• Best sensitivity</li> <li>• Narrow ranges (e.g. medical)</li> <li>• Point sensing</li> </ul>
