

#### Chapter 3 - part 2

Arithmetic for Computers

- Multiplication (comment on)
- Division

## **Multiplication Hardware**

Chapter 3 — Arithmetic for Computers — 3

# **Optimized Multiplier**

#### Perform steps in parallel: add/shift

One cycle per partial-product addition
That's ok, if frequency of multiplications is low

Chapter 3 — Arithmetic for Computers — 4

## **MIPS Multiplication**

- Two 32-bit registers for product
  - HI: most-significant 32 bits
  - LO: least-significant 32-bits
- Instructions
  - mult rs, rt / multu rs, rt
    - 64-bit product in HI/LO
  - mfhi rd / mflo rd
    - Move from HI/LO to rd
    - Can test HI value to see if product overflows 32 bits
  - mul rd, rs, rt (pseudo instruction)
    - Least-significant 32 bits of product —> rd

# Division

*n*-bit operands yield *n*-bit quotient and remainder

- Check for 0 divisor
- Long division approach
  - If divisor  $\leq$  dividend bits
    - 1 bit in quotient, subtract
  - Otherwise
    - 0 bit in quotient, bring down next dividend bit
- Restoring division
  - Do the subtract, and if remainder goes < 0, add divisor back</li>
- Signed division
  - Divide using absolute values
  - Adjust sign of quotient and remainder as required

### **Division Hardware**

## **Division Hardware**

### **Division Hardware**

# **Optimized Divider**

- One cycle per partial-remainder subtraction
- Looks a lot like a multiplier!
  - Same hardware can be used for both

## **Faster Division**

- Can't use parallel hardware as in multiplier
  - Subtraction is conditional on sign of remainder
- Faster dividers (e.g. SRT devision) generate multiple quotient bits per step
  - Still require multiple steps

# **MIPS Division**

- Use HI/LO registers for result
  - HI: 32-bit remainder
  - LO: 32-bit quotient
- Instructions
  - div rs, rt / divu rs, rt
  - No overflow or divide-by-0 checking
    - Software must perform checks if required
  - Use mfhi, mflo to access result
